Introduction to Separation Techniques

Separation processes in chemical engineering are designed to partition mixtures into their constituent components based on differences in physical or chemical properties. The choice of an appropriate separation method depends on factors such as the nature of the mixture (homogeneous or heterogeneous), the physical state of components (liquid, solid, gas), the required purity levels, energy considerations, and economic feasibility. Historically, separation techniques have evolved from simple physical methods like filtration and distillation to complex membrane and chromatography processes. Modern chemical engineering leverages an integrated approach, often combining multiple methods to optimize efficiency and selectivity.

Classification of Separation Techniques

Separation methods can be broadly classified based on the principle they utilize: 1. Physical Separation Techniques These rely on physical differences between components such as boiling point, density, particle size, or solubility. 2.
