2. **Scaling:** Changing the size of objects uniformly or non-uniformly.
3. **Rotation:** Spinning objects around a given axis.
4. **Shearing and Reflection:** Distorting or flipping objects as needed.

These transformations are represented mathematically via matrices, enabling complex modeling sequences.

Parametric and Implicit Surfaces

Modeling smooth surfaces is central to realistic graphics.

1. **Parametric Surfaces:** Defined by parameters (u, v) that generate points on the surface, such as Bezier and B-spline surfaces.
2. **Implicit Surfaces:** Defined by equations like $F(x, y, z) = 0$, representing shapes like spheres, toroids, and more complex forms.

Rogers discusses how these approaches facilitate flexible surface modeling and rendering.

Numerical Methods in Computer Graphics

Numerical techniques are crucial for solving equations and performing approximations.

1. **Interpolation and Approximation:** Creating smooth curves and surfaces.
2. **Numerical Integration:** Calculating lighting, shading, and physical simulations.
3. **Optimization Algorithms:** For rendering efficiency and object fitting.

Implementing these methods enables the creation of high-quality graphics within practical timeframes.
