Introduction to Limb Amputations and Deficiencies

Limb amputation refers to the surgical removal of a limb or part of a limb, typically due to trauma, vascular disease, infection, or tumor. Limb deficiencies, on the other hand, involve congenital or acquired conditions where a limb is absent or underdeveloped. Both conditions present unique challenges requiring tailored surgical planning, rehabilitation, and prosthetic fitting. The primary goals of surgical intervention include: - Restoring function - Achieving pain relief - Facilitating prosthetic use - Improving psychosocial well-being Given the diversity of causes and presentations, a standardized approach to classification and surgery is vital for effective management.

Its significance includes: - Ensuring consistency in terminology and surgical planning - Guiding surgeons through complex procedures - Facilitating education and training - Supporting research and comparative outcomes analysis The "Atlas of Amputations and Limb Deficiencies Surgical" integrates anatomical, pathological, and surgical perspectives, offering a systematic approach to these conditions.

Classification Systems in Limb Amputations

Effective classification underpins surgical decision-making, prosthetic design, and rehabilitation planning. Various systems have been developed, with some of the most recognized including: 2.1. The ISPO (International Society for Prosthetics and Orthotics) Classification The ISPO classification categorizes amputations based on: - Level of amputation: upper or lower limb - Specific anatomical level: e.g., transhumeral, transfemoral, below-knee, above-knee - Type of residual limb: e.g., transosseous, disarticulation 2.2. The Tomeno Classification This system focuses on: - Type of deficiency: congenital vs. acquired - Extent of tissue involvement: osseous, muscular, neurovascular structures - Functional implications 2.3. The Swanson Classification Specially designed for congenital limb deficiencies, emphasizing: - Type of deficiency: longitudinal, transverse, mixed - Severity and functional prognosis The atlas consolidates these systems, providing a hierarchical approach that aids in surgical planning and communication among clinicians.

Surgical Techniques for Amputation

Surgical procedures are tailored to the level and nature of the limb loss or deficiency. The atlas details various techniques, emphasizing principles such as preserving optimal residual limb length, ensuring good wound healing, and optimizing prosthetic fitting. 2.1. Upper Limb Amputations Upper limb amputations are categorized based on the level: - Partial hand amputations: finger or partial palm removal - Wrist disarticulations: removal at the radiocarpal joint - Transradial (below-elbow): through the radius and ulna - Transhumeral (above-elbow): through the humerus - Shoulder disarticulations and forequarter amputations Key surgical considerations: - Preservation of joint function where possible - Maintaining length for improved prosthetic control - Managing neurovascular structures to reduce neuroma formation 2.2. Lower Limb Amputations Common levels include: -

Toe and partial foot amputations for minor trauma or ischemia - Syme's amputation: ankle disarticulation - Below-knee (transtibial): preserving the knee joint - Above-knee (transfemoral): removal through the femur - Hip disarticulations and hemipelvectomy Surgical principles include: - Achieving a stable, well-healed residual limb - Minimizing soft tissue trauma - Ensuring proper alignment for prosthetic fitting 2.3. Disarticulations and Special Techniques Disarticulation procedures, such as shoulder and hip disarticulations, are performed in cases of extensive disease or trauma. Techniques involve: - Carefully separating neurovascular bundles - Preserving functional musculature - Managing residual limb length for prosthetic use The atlas provides detailed surgical illustrations, emphasizing soft tissue management and residual limb shaping.

Management of Limb Deficiencies

Congenital limb deficiencies require a different surgical approach, often focusing on: - Enhancing function - Facilitating prosthetic use - Correcting deformities 2.1. Types of Congenital Deficiencies - Transverse deficiencies: limb is absent beyond a certain level - Longitudinal deficiencies: absence or hypoplasia of specific bones or tissues within a limb 2.2. Surgical Interventions Procedures may include: - Soft tissue lengthening - Bone lengthening (distraction osteogenesis) - Corrective osteotomies - Muscle transfers The atlas underscores the importance of early intervention and multidisciplinary coordination in managing these cases.

Postoperative Management and Rehabilitation

Successful surgical outcomes depend heavily on postoperative care: - Wound care and infection prevention - Residual limb shaping - Pain management, including neuroma treatment - Early mobilization and physiotherapy - Psychosocial support Rehabilitation aims to maximize functional independence, with prosthetic training being a cornerstone.

Outcomes and Complications

The atlas consolidates data on: - Functional outcomes: mobility, dexterity, independence - Prosthetic integration: comfort, control, durability - Complications: wound infection, neuroma, phantom limb pain, skin breakdown Understanding these factors guides surgeons in optimizing techniques and improving patient quality of life.
