What Is Machine Learning?

Machine learning is a subset of artificial intelligence that enables systems to learn patterns from data and make predictions or decisions without being explicitly programmed for specific tasks. It relies on algorithms that identify relationships within data, generalize from training examples, and

improve performance over time.

Types of Machine Learning

ML can be broadly categorized into three types:

1. **Supervised Learning:** Models learn from labeled datasets to predict outcomes. Example applications include spam detection and image classification.
2. **Unsupervised Learning:** Algorithms identify patterns or groupings in unlabeled data, such as customer segmentation or anomaly detection.
3. **Reinforcement Learning:** Systems learn by interacting with environments, receiving feedback in the form of rewards or penalties, used in robotics and game playing.

Core Concepts and Techniques

1. **Features and Labels:** Features are input variables; labels are the target outputs.
2. **Training and Testing:** Data is split into training sets for model learning and testing sets for evaluation.
3. **Overfitting and Underfitting:** Balancing model complexity to generalize well to unseen data.
4. **Evaluation Metrics:** Accuracy, precision, recall, F1-score, and others measure model performance.

The Power of scikit-learn in Machine Learning
