4. Physical constraints (size, weight)
5. Environmental conditions

These parameters guide the entire design process and influence the choice of optical components and layout strategies.

2. Initial Conceptual Design

Using Zemax's intuitive interface, designers can set up a basic optical layout by selecting lenses, mirrors, and other elements from a comprehensive catalog or custom definitions. Key steps include:

1. Placing the primary optical elements
2. Defining the optical path and aperture stops
3. Setting initial parameters like focal length, field of view, and aperture sizes

This stage aims to produce a functional baseline system that meets basic imaging or illumination needs.

3. Sequential Ray Tracing and Initial Optimization

Once the initial layout is established, sequential ray tracing is performed to analyze image quality metrics such as:

1. Spot size
2. Modulation transfer function (MTF)
3. Distortion
4. Field curvature

Optimization algorithms then iteratively refine parameters like lens curvatures, thicknesses, and spacing to improve these metrics. Zemax provides tools like:

1. Sequential Optimization
2. Merit Functions to define performance goals
3. Constraints to maintain manufacturability

4. Advanced Analysis and Validation

After achieving satisfactory image quality, designers conduct comprehensive analyses, including:

1. Chromatic aberration analysis across the wavelength range
2. Field performance and off-axis aberrations
3. Stray light and ghost image analysis
4. Tolerance studies to assess sensitivity to manufacturing errors

Physical optics propagation may be employed to evaluate diffraction effects in high-precision systems.
