Key Elements Analyzed in Hydrocarbon Processing

While hydrocarbons are primarily composed of carbon and hydrogen, the presence of heteroatoms significantly impacts processing and product quality:

Major Elements

- Carbon (C): Constitutes the backbone of hydrocarbons, critical for calculating calorific values and molecular formulas.
- Hydrogen (H): Paired with carbon, influences combustion properties and product qualities.

Impurities and Heteroatoms

- Sulfur (S): Present as mercaptans, sulfides, or thiols; causes corrosion, catalyst poisoning, and environmental pollution.
- Nitrogen (N): Found in amines, nitriles, or heterocyclic compounds; can poison catalysts and affect fuel properties.
- Oxygen (O): Often introduced through processing; influences stability and combustion.
- Metals (Fe, Ni, V, etc.): Derived from catalysts or contaminated feedstocks; can deactivate catalysts and cause equipment fouling. Accurate quantification of these

elements is vital for process control, catalyst selection, and environmental management.

Methodologies for Elemental Analysis in Petrochemical Applications

Various analytical techniques are employed, each suited to specific elements, matrices, and precision requirements. The main methods include:

Combustion Analysis
