Sample Practice Questions for the Earth Science Regents

Multiple Choice Sample

1. Which layer of Earth is responsible for Earth's magnetic field? - a) Crust - b) Outer core - c) Mantle - d) Inner core
Answer: b) Outer core
2. What type of rock is formed from cooled and solidified magma or lava? - a) Sedimentary - b) Igneous - c) Metamorphic - d) Fossiliferous
Answer: b) Igneous

Short Answer Example

Describe how the process of sea-floor spreading supports the theory of plate tectonics. Sample Response: Sea-floor spreading occurs at divergent plate boundaries, where new oceanic crust is formed as magma rises from the mantle. This process causes the continents to move apart and supports the theory of plate tectonics by explaining the creation of new ocean floors and the movement of Earth's plates.

Extended Response Practice

Explain the relationship between Earth's internal structure and volcanic activity. Sample Response: Earth's internal structure consists of the crust, mantle, outer core, and inner core. Volcanic activity primarily occurs at divergent and convergent plate boundaries where magma from the mantle can reach the surface. At divergent boundaries, such as mid-ocean ridges, magma rises to fill the gap created by moving tectonic plates, forming new crust. At convergent boundaries, subduction zones cause melting of mantle material, leading to magma formation that can result in volcanic eruptions. The movement and composition of Earth's internal layers directly influence the location and type of volcanic activity.
