Introduction to Feedback Control of Dynamic Systems

Feedback control is a method of controlling a system by continuously monitoring its output and adjusting the input accordingly to achieve desired performance. Franklin's 5th edition emphasizes the importance of feedback in managing system uncertainties, disturbances, and non-linearities, ensuring that the system behaves predictably and efficiently.

Fundamental Concepts in Feedback Control

Open-Loop vs. Closed-Loop Control

2. **Controller:** Processes the feedback signal and determines the necessary input adjustments.
3. **Actuator:** Implements the control input to the system.
4. **Plant:** The dynamic system being controlled.

Mathematical Modeling of Dynamic Systems

Franklin's approach emphasizes the importance of precise modeling, often expressed through differential equations, transfer functions, or state-space representations.

Transfer Function Representation
